Automated Theorem Proving

Prof. Dr. Jasmin Blanchette, Yiming Xu, PhD, Lydia Kondylidou, and Tanguy Bozec based on exercises by Dr. Uwe Waldmann

Winter Term 2025/26

Exercises 2: Preliminaries Continued and Propositional Logic

Exercise 2.1: Determine all strict total orderings \succ on the set $\{a, b, c, d, e\}$ such that the following properties hold simultaneously:

- (1) $\{a,b\} \succ_{\text{mul}} \{a,a,c\}$
- (2) $\{c,d\} \succ_{\text{mul}} \{b,b,b\}$
- (3) $\{a, e\} \succ_{\text{mul}} \{c, e, e\}$

Exercise 2.2: Let M be a set, and let \succ be a strict partial ordering over M. Let $b, b_1, b_2 \in M$, and let S, S_1, S_2 be finite multisets over M.

- (a) Prove or refute: If $\{b\} \succ_{\text{mul}} S_1$ and $\{b\} \succ_{\text{mul}} S_2$, then $\{b\} \succ_{\text{mul}} S_1 \cup S_2$.
- (b) Prove or refute: If $S \succ_{\text{mul}} \{b_1\}$ and $S \succ_{\text{mul}} \{b_2\}$, then $S \succ_{\text{mul}} \{b_1, b_2\}$.

Exercise 2.3: (a) Let $M = \{a, b, c, d\}$. Suppose that the binary relation \rightarrow over multisets over M is defined by the rules (1)-(3):

- $(1) \qquad S \cup \{b, c\} \to S \cup \{a, a, a\}$
- $(2) \qquad S \cup \{b, a\} \rightarrow S \cup \{b, c, c\}$
- $(3) \qquad S \cup \{c\} \to S \cup \{d\}$

Then \rightarrow can be shown to be terminating using the multiset extension \succ_{mul} of an appropriate well-founded ordering on M. What does \succ look like?

(b) If the binary relation \rightarrow is defined by the rules (4)–(6),

- $(4) \qquad S \cup \{a,a\} \to S \cup \{b,c\}$
- $(5) \qquad S \cup \{b, b\} \to S \cup \{a, c\}$
- $(6) \qquad S \cup \{b,c\} \ \rightarrow \ S \cup \{a,d,c,c\}$

then there is no well-founded ordering on M such that \rightarrow is contained in \succ_{mul} . Why? Give a short explanation.

(c) Nevertheless, the relation \rightarrow defined by the rules (4)–(6) is terminating. Prove it. (Hint: Think about lexicographic combinations.)

Exercise 2.4 (*): Prove: If S and S' are finite multisets over a set M, and $S \succ_{\text{mul}} S'$ holds for every strict partial ordering \succ over M, then $S' \subset S$ (that is, $S' \subseteq S$ and $S' \neq S$).

Exercise 2.5: Which of the following propositional formulas are valid? Which are satisfiable?

- (1) $\neg P$
- (2) $P \rightarrow \bot$
- $(3) \perp \to P$
- $(4) \ (P \lor Q) \to P$
- (5) $P \to (Q \to P)$
- $(6) \ Q \to \neg Q$
- (7) $Q \wedge \neg Q$
- $(8) \neg (\neg P \land \neg \neg P)$

Exercise 2.6 (*): Let $N = \{C_1, \ldots, C_n\}$ be a finite set of propositional clauses without duplicated literals or complementary literals such that for every $i \in \{1, \ldots, n\}$ the clause C_i has exactly *i* literals. Prove or refute: N is satisfiable.

Exercise 2.7: Let F, G, H be propositional formulas, let p be a position of H. Prove or refute: If $H[F]_p$ is valid and $H[G]_p$ is valid, then $H[F \lor G]_p$ is valid.

Exercise 2.8: Let F, G, H be propositional formulas, let p be a position of H. Prove or refute: If $H[F \wedge G]_p$ is valid, then $H[F]_p$ and $H[G]_p$ are valid.

Exercise 2.9: Let Π be a set of propositional variables with $P, Q \in \Pi$. For every propositional formula F over Π , let $\phi(F)$ be the formula that one obtains from F by replacing every occurrence of P by $P \lor Q$. For instance, if $F = ((R \lor \neg P) \land (Q \lor P))$, then $\phi(F) = ((R \lor \neg (P \lor Q)) \land (Q \lor (P \lor Q)))$, and if F = R, then $\phi(F) = R$.

(a) Prove: If $\phi(F)$ is satisfiable, then F is satisfiable. (Note: It is sufficient if you consider propositional variables, negations, and conjunctions; the other cases are treated analogously.)

(b) Refute: If $\phi(F)$ is valid, then F is valid.

Exercise 2.10: Let Π be a set of propositional variables. Let Q and R be two propositional variables in Π . For any Π -formula F let $\phi(F)$ be the formula that one obtains by replacing every occurrence of Q in F by R.

Prove: If $\phi(F)$ is satisfiable, then F is satisfiable. (It is sufficient if you consider propositional variables, conjunctions, and negations; the other cases are handled analogously.)

Exercise 2.11: Let N be a set of propositional clauses. Prove or refute the following statement: If N contains clauses $C_i \vee D_i$ $(i \in \{1, \ldots, n\})$ such that $\{C_i \mid i \in \{1, \ldots, n\}\} \models \bot$, then $N \models \bigvee_{i \in \{1, \ldots, n\}} D_i$.
