# 4.6 Knuth–Bendix Completion

Completion:

Goal: Given a set E of equations, transform E into an equivalent convergent set R of rewrite rules.

(If R is finite: decision procedure for E.)

How to ensure termination?

Fix a reduction ordering  $\succ$  and construct R in such a way that  $\rightarrow_R \subseteq \succ$  (i.e.,  $l \succ r$  for every  $l \rightarrow r \in R$ ).

How to ensure confluence?

Check that all critical pairs are joinable.

Note: Every critical pair  $\langle s, t \rangle$  can be *made* joinable by adding  $s \to t$  or  $t \to s$  to R.

(Actually, we first add  $s \approx t$  to E and later try to turn it into a rule that is contained in  $\succ$ ; this gives us more freedom.)

The completion procedure is presented as a set of inference rules working on a set of equations E and a set of rules R:

 $E_0, R_0 \vdash E_1, R_1 \vdash E_2, R_2 \vdash \cdots$ 

At the beginning,  $E = E_0$  is the input set and  $R = R_0$  is empty. At the end, *E* should be empty; then *R* is the result.

For each step  $E, R \vdash E', R'$ , the equational theories of  $E \cup R$  and  $E' \cup R'$ agree:  $\approx_{E \cup R} = \approx_{E' \cup R'}$ .

Notations:

```
The formula s \approx t denotes either s \approx t or t \approx s.
```

CP(R) denotes the set of all critical pairs between rules in R.

Orient:

$$\frac{E \cup \{s \stackrel{\cdot}{\approx} t\}, R}{E, R \cup \{s \rightarrow t\}} \quad \text{if } s \succ t$$

Note: There are equations  $s \approx t$  that cannot be oriented, i.e., neither  $s \succ t$  nor  $t \succ s$ .

Trivial equations cannot be oriented—but we do not need them anyway:

Delete:  $\frac{E \cup \{s \approx s\}, R}{E, R}$ 

Critical pairs between rules in R are turned into additional equations:

Deduce:

$$\frac{E, R}{E \cup \{s \approx t\}, R} \quad \text{if } \langle s, t \rangle \in \mathsf{CP}(R).$$

Note: If  $(s, t) \in CP(R)$ , then  $s \leftarrow_R u \rightarrow_R t$  and hence  $R \models s \approx t$ .

The following inference rules are not strictly necessary, but are very useful (e.g., to eliminate joinable critical pairs and to cope with equations that cannot be oriented):

Simplify-Eq:  $\frac{E \cup \{s \stackrel{\cdot}{\approx} t\}, R}{E \cup \{u \approx t\}, R} \quad \text{if } s \rightarrow_R u.$ 

Simplification of the right-hand side of a rule is unproblematic:

*R-Simplify-Rule:* 

$$\frac{E, \quad R \cup \{s \to t\}}{E, \quad R \cup \{s \to u\}} \quad \text{if } t \to_R u.$$

Simplification of the left-hand side may influence orientability and orientation. Therefore, it yields an *equation*:

*L-Simplify-Rule:* 

$$\frac{E, R \cup \{s \to t\}}{E \cup \{u \approx t\}, R} \quad \text{if } s \to_R u \text{ using a rule } I \to r \in R \\ \text{such that } s \sqsupset I \text{ (see next slide).}$$

For technical reasons, the lhs of  $s \to t$  may only be simplified using a rule  $I \to r$  if  $I \to r$  cannot be simplified using  $s \to t$ , that is, if  $s \sqsupset I$ , where the encompassment quasi-ordering  $\supseteq$  is defined by

$$s \supseteq I$$
 if  $s|_p = I\sigma$  for some  $p$  and  $\sigma$ 

and  $\Box = \Box \setminus \Box$  is the strict part of  $\Box$ .

Lemma 4.6.1: □ is a well-founded strict partial ordering.

Lemma 4.6.2: If  $E, R \vdash E', R'$ , then  $\approx_{E \cup R} = \approx_{E' \cup R'}$ .

Lemma 4.6.3: If  $E, R \vdash E', R'$  and  $\rightarrow_R \subseteq \succ$ , then  $\rightarrow_{R'} \subseteq \succ$ .

Note: Like in ordered resolution, simplification should be preferred to deduction:

- Simplify/delete whenever possible.
- Otherwise, orient an equation if possible.
- Last resort: compute critical pairs.

## **Knuth–Bendix Completion: Example**

We apply the Knuth-Bendix procedure to the set of equations

- $add(zero, zero) \approx zero$  (1)  $add(x, succ(y)) \approx succ(add(x, y))$  (2)
  - $add(succ(x), y) \approx succ(add(x, y))$  (3)

using the lpo with the precedence  $add \succ succ \succ zero$ .

We first apply "Orient" to (1)-(3), resulting in the rewrite rules

 $add(zero, zero) \rightarrow zero \quad (4) \qquad add(x, succ(y)) \rightarrow succ(add(x, y)) \quad (5)$  $add(succ(x), y) \rightarrow succ(add(x, y)) \quad (6)$ 

- $add(zero, zero) \rightarrow zero \quad (4) \qquad add(x, succ(y)) \rightarrow succ(add(x, y)) \quad (5)$  $add(succ(x), y) \rightarrow succ(add(x, y)) \quad (6)$
- Then we apply "Deduce" between (5) and a renamed copy of (6):

 $succ(add(succ(x), y)) \approx succ(add(x, succ(y)))$  (7)

We can now apply "Simplify-Eq" to both sides of (7) using (6) and (5):

 $succ(succ(add(x, y))) \approx succ(succ(add(x, y)))$  (8)

This last equation is trivial and can be deleted using "Delete."

All critical pairs have been checked.

The resulting term rewrite system is  $\{(4), (5), (6)\}$ .

What can happen if we run the completion procedure on a set E of equations?

- (1) We reach a state where no more inference rules are applicable and E is not empty.
  - $\Rightarrow$  Failure (try again with another ordering?)
- (2) We reach a state where E is empty and all critical pairs between the rules in the current R have been checked.
- (3) The procedure runs forever.

To treat these cases simultaneously, we need some definitions.

A (finite or infinite sequence)  $E_0$ ,  $R_0 \vdash E_1$ ,  $R_1 \vdash E_2$ ,  $R_2 \vdash \cdots$  with  $R_0 = \emptyset$  is called a run of the completion procedure with input  $E_0$  and  $\succ$ .

For a run, 
$$E_{\cup} = \bigcup_{i \ge 0} E_i$$
 and  $R_{\cup} = \bigcup_{i \ge 0} R_i$ .

The sets of persistent equations or rules of the run are  $E_{\infty} = \bigcup_{i \ge 0} \bigcap_{j \ge i} E_j$ and  $R_{\infty} = \bigcup_{i \ge 0} \bigcap_{j \ge i} R_j$ .

Note: If the run is finite and ends with  $E_n$ ,  $R_n$ , then  $E_{\infty} = E_n$  and  $R_{\infty} = R_n$ .

A run is called fair if  $CP(R_{\infty}) \subseteq E_{\cup}$ 

(i.e., if every critical pair between persisting rules is computed at some step of the derivation).

Goal:

Show: If a run is fair and  $E_{\infty}$  is empty, then  $R_{\infty}$  is convergent and equivalent to  $E_0$ .

In particular: If a run is fair and  $E_\infty$  is empty,

then  $\approx_{E_0} = \approx_{E_{\cup} \cup R_{\cup}} = \leftrightarrow_{E_{\cup} \cup R_{\cup}}^* = \downarrow_{R_{\infty}}.$ 

General assumptions from now on:

$$E_0, R_0 \vdash E_1, R_1 \vdash E_2, R_2 \vdash \cdots$$
 is a fair run.

 $R_0$  and  $E_\infty$  are empty.

- A proof of  $s \approx t$  in  $E_{\cup} \cup R_{\cup}$  is a finite sequence  $(s_0, \ldots, s_n)$  such that  $s = s_0, t = s_n$ , and for all  $i \in \{1, \ldots, n\}$ :
- (1)  $s_{i-1} \leftrightarrow_{E_{\cup}} s_i$ , or (2)  $s_{i-1} \rightarrow_{R_{\cup}} s_i$ , or
- (3)  $s_{i-1} \leftarrow_{R_{\cup}} s_i$ .

The pairs  $(s_{i-1}, s_i)$  are called proof steps.

A proof is called a rewrite proof in  $R_{\infty}$ if there is a  $k \in \{0, ..., n\}$  such that  $s_{i-1} \rightarrow_{R_{\infty}} s_i$  for  $1 \le i \le k$ and  $s_{i-1} \leftarrow_{R_{\infty}} s_i$  for  $k+1 \le i \le n$ 

Idea (Bachmair, Dershowitz, Hsiang):

- Define a well-founded ordering on proofs such that for every proof that is not a rewrite proof in  $R_{\infty}$  there is an equivalent smaller proof.
- Consequence: For every proof there is an equivalent rewrite proof in  $R_{\infty}$ .

We associate a cost  $c(s_{i-1}, s_i)$  with every proof step as follows:

(1) If  $s_{i-1} \leftrightarrow_{E_{\cup}} s_i$ , then  $c(s_{i-1}, s_i) = (\{s_{i-1}, s_i\}, -, -)$ , where the first component is a multiset of terms and - denotes an arbitrary (irrelevant) term.

(2) If 
$$s_{i-1} \to_{R_{\cup}} s_i$$
 using  $l \to r$ , then  $c(s_{i-1}, s_i) = (\{s_{i-1}\}, l, s_i)$ .  
(3) If  $s_{i-1} \leftarrow_{R_{\cup}} s_i$  using  $l \to r$ , then  $c(s_{i-1}, s_i) = (\{s_i\}, l, s_{i-1})$ .

Proof steps are compared using the lexicographic combination of the multiset extension of the reduction ordering  $\succ$ , the encompassment ordering  $\Box$ , and the reduction ordering  $\succ$ .

The cost c(P) of a proof P is the multiset of the costs of its proof steps.

The proof ordering  $\succ_c$  compares the costs of proofs using the multiset extension of the proof step ordering.

Lemma 4.6.4:  $\succ_c$  is a well-founded ordering.

Lemma 4.6.5:

Let P be a proof in  $E_{\cup} \cup R_{\cup}$ . If P is not a rewrite proof in  $R_{\infty}$ , then there exists an equivalent proof P' in  $E_{\cup} \cup R_{\cup}$  such that  $P \succ_{c} P'$ .

#### Proof:

If P is not a rewrite proof in  $R_{\infty}$ , then it contains

(a) a proof step that is in  $E_{\cup}$ , or (b) a proof step that is in  $R_{\cup} \setminus R_{\infty}$ , or (c) a subproof  $s_{i-1} \leftarrow_{R_{\infty}} s_i \rightarrow_{R_{\infty}} s_{i+1}$  (peak).

We show that in all three cases the proof step or subproof can be replaced by a smaller subproof:

Case (a): A proof step using an equation  $s \approx t$  is in  $E_{\cup}$ . This equation must be deleted during the run.

If  $s \approx t$  is deleted using *Orient*:

 $\ldots s_{i-1} \leftrightarrow_{E_{\cup}} s_i \ldots \implies \ldots s_{i-1} \rightarrow_{R_{\cup}} s_i \ldots$ 

If  $s \approx t$  is deleted using *Delete*:

 $\ldots S_{i-1} \leftrightarrow_{E_{\cup}} S_{i-1} \ldots \Longrightarrow \ldots S_{i-1} \ldots$ 

If  $s \approx t$  is deleted using *Simplify-Eq*:  $\dots s_{i-1} \leftrightarrow_{E_{\cup}} s_i \dots \implies \dots s_{i-1} \rightarrow_{R_{\cup}} s' \leftrightarrow_{E_{\cup}} s_i \dots$ 

Case (b): A proof step using a rule  $s \to t$  is in  $R_{\cup} \setminus R_{\infty}$ . This rule must be deleted during the run.

If  $s \rightarrow t$  is deleted using *R*-*Simplify*-*Rule*:

$$\ldots s_{i-1} \rightarrow_{R_{\cup}} s_i \ldots \implies \ldots s_{i-1} \rightarrow_{R_{\cup}} s' \leftarrow_{R_{\cup}} s_i \ldots$$

If  $s \rightarrow t$  is deleted using *L-Simplify-Rule*:

$$\ldots s_{i-1} \rightarrow_{R_{\cup}} s_i \ldots \implies \ldots s_{i-1} \rightarrow_{R_{\cup}} s' \leftrightarrow_{E_{\cup}} s_i \ldots$$

Case (c): A subproof has the form  $s_{i-1} \leftarrow_{R_{\infty}} s_i \rightarrow_{R_{\infty}} s_{i+1}$ .

If there is no overlap or a noncritical overlap:

 $\ldots s_{i-1} \leftarrow_{R_{\infty}} s_i \rightarrow_{R_{\infty}} s_{i+1} \ldots \implies \ldots s_{i-1} \rightarrow^*_{R_{\infty}} s' \leftarrow^*_{R_{\infty}} s_{i+1} \ldots$ 

If there is a critical pair that has been added using "Deduce":

$$\ldots s_{i-1} \leftarrow_{R_{\infty}} s_i \rightarrow_{R_{\infty}} s_{i+1} \ldots \Longrightarrow \ldots s_{i-1} \leftrightarrow_{E_{\cup}} s_{i+1} \ldots$$

In all cases, checking that the replacement subproof is smaller than the replaced subproof is routine.

Theorem 4.6.6: Let  $E_0, R_0 \vdash E_1, R_1 \vdash E_2, R_2 \vdash \cdots$  be a fair run and let  $R_0$  and  $E_\infty$  be empty. Then

(1) every proof in  $E_{\cup} \cup R_{\cup}$  is equivalent to a rewrite proof in  $R_{\infty}$ ,

- (2)  $R_{\infty}$  is equivalent to  $E_0$ , and
- (3)  $R_{\infty}$  is convergent.

Proof:

(1) By well-founded induction on  $\succ_c$  using the previous lemma.

(2) Clearly  $\approx_{E_{\cup}\cup R_{\cup}} = \approx_{E_0}$ . Since  $R_{\infty} \subseteq R_{\cup}$ , we get  $\approx_{R_{\infty}} \subseteq \approx_{E_{\cup}\cup R_{\cup}}$ . On the other hand, by (1),  $\approx_{E_{\cup}\cup R_{\cup}} \subseteq \approx_{R_{\infty}}$ .

(3) Since  $\rightarrow_{R_{\infty}} \subseteq \succ$ ,  $R_{\infty}$  is terminating. By (1),  $R_{\infty}$  is confluent.

# 4.7 Unfailing Completion

Classical completion:

- Try to transform a set E of equations into an equivalent convergent TRS.
- Fail if an equation can be neither oriented nor deleted.
- Unfailing completion (Bachmair, Dershowitz, and Plaisted):
  - If an equation cannot be oriented, we can still use *orientable instances* for rewriting.
  - Note: If  $\succ$  is total on ground terms, then every *ground instance* of an equation is trivial or can be oriented.
  - Goal: Derive a ground convergent set of equations.

# **Unfailing Completion**

Outlook:

Combine ordered resolution and unfailing completion to get a calculus for equational clauses:

compute inferences between (strictly) maximal literals
as in ordered resolution,
compute overlaps between maximal sides of equations
as in unfailing completion

 $\Rightarrow$  Superposition calculus.
